Introduction

In this phase of our project, NEXUSWrites becomes more interactive as the frontend and backend are finally connected into a working system. The focus is on integrating forms with API routes, allowing user input to be collected, validated, and sent to the server. Through JavaScript, form submissions are handled efficiently, and users receive clear feedback such as success or error messages, making the application more responsive and user-friendly.

This stage marks an important transition for NEXUSWrites, as it moves from a static interface to a functional web application. Data can now flow smoothly from the user interface to the backend and into the database, ensuring that information is properly processed and stored. Overall, this phase strengthens the system by enabling real-time interactions and improving the overall user experience.

Objectives

By the end of this activity, we were able to:

- Connect HTML form inputs on the frontend to their respective backend routes.
- Utilize JavaScript tools like `fetch()` or `axios` to manage POST requests.
- Store submitted form data in MongoDB through API integration.
- Apply input validation before sending data to the server.
- Show appropriate success or error messages to users based on API responses.
- Practice proper commit habits and consistently push functional updates to GitHub.

I. HTML Form Interface

- index.html

-This shows the main landing page of the NEXUSWrites system where users are welcomed and introduced to the platform. It serves as the entry point to access the different sections of the website.

- overview.html

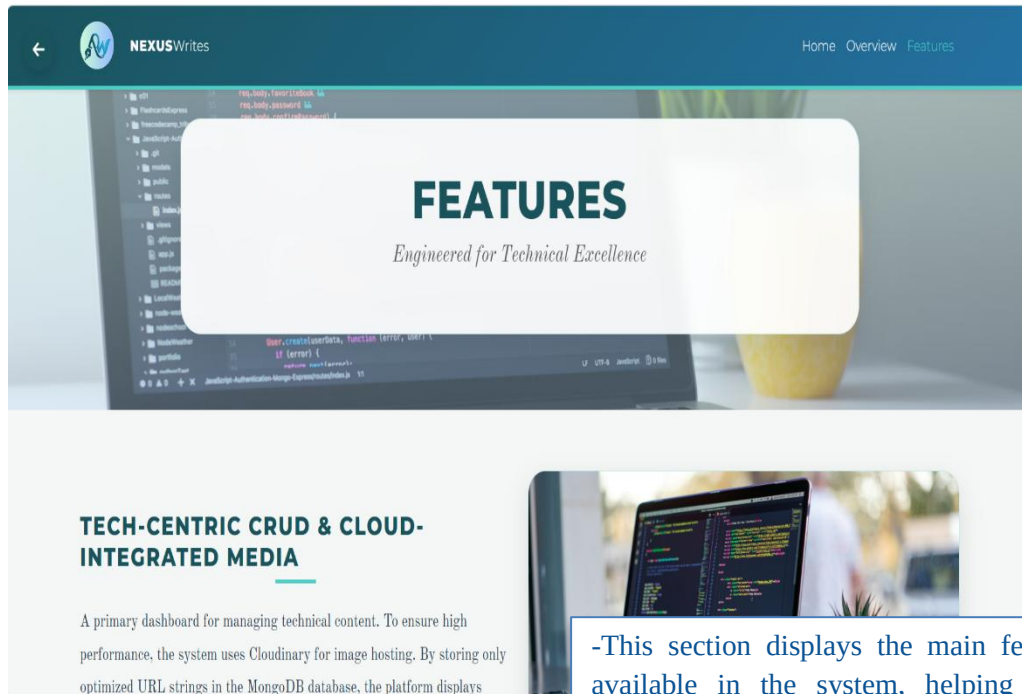

-This page provides an overview of the platform, giving users a brief explanation of the purpose and features of NEXUSWrites.

Bicol University
POLANGUI CAMPUS
Centro Occidental Polangui, Albay

- **features.html**

-This section displays the main features available in the system, helping users understand the tools and functionalities they can access.

- **signup.html**

- **notification.html**

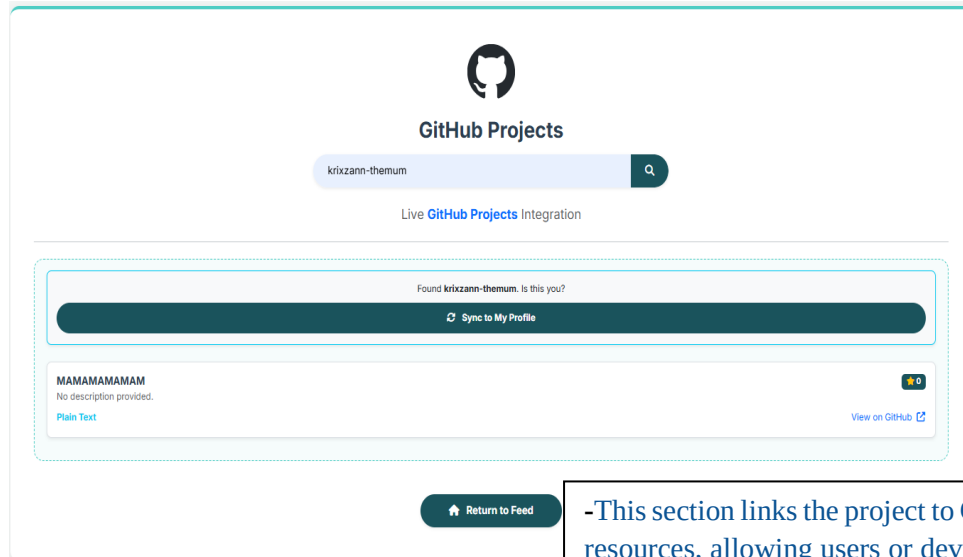

-This page shows alerts and updates related to user activity, ensuring that users stay informed of recent interactions.

- **github.html**

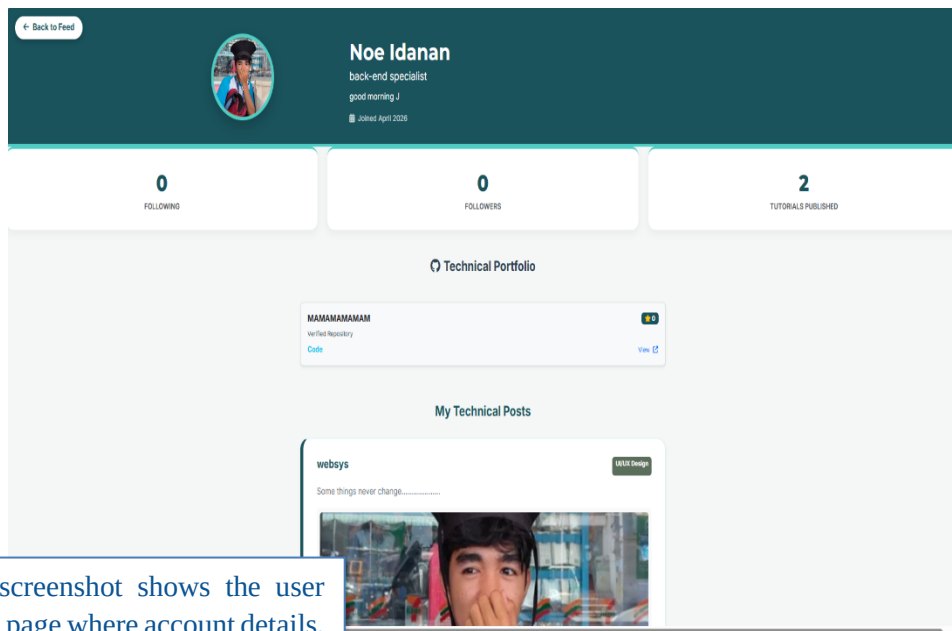

Bicol University
POLANGUI CAMPUS
Centro Occidental Polangui, Albay

-This section links the project to GitHub resources, allowing users or developers to access repository-related information.

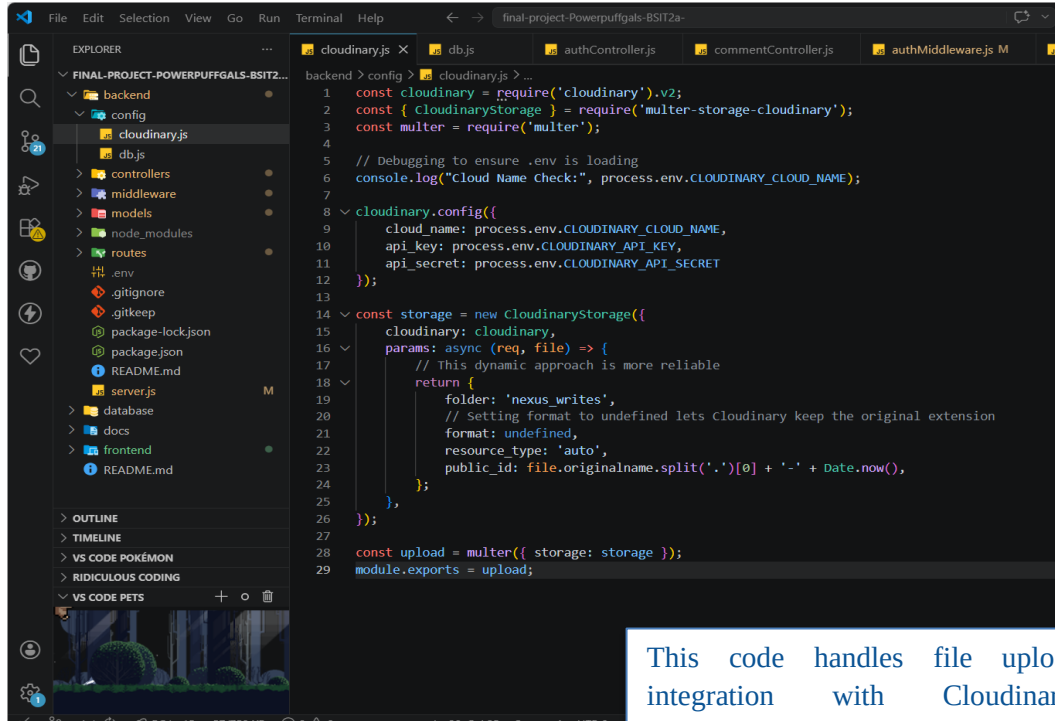

- **profile.html**

This screenshot shows the user profile page where account details, activity, and personal information are displayed.

II. JavaScript API Integration

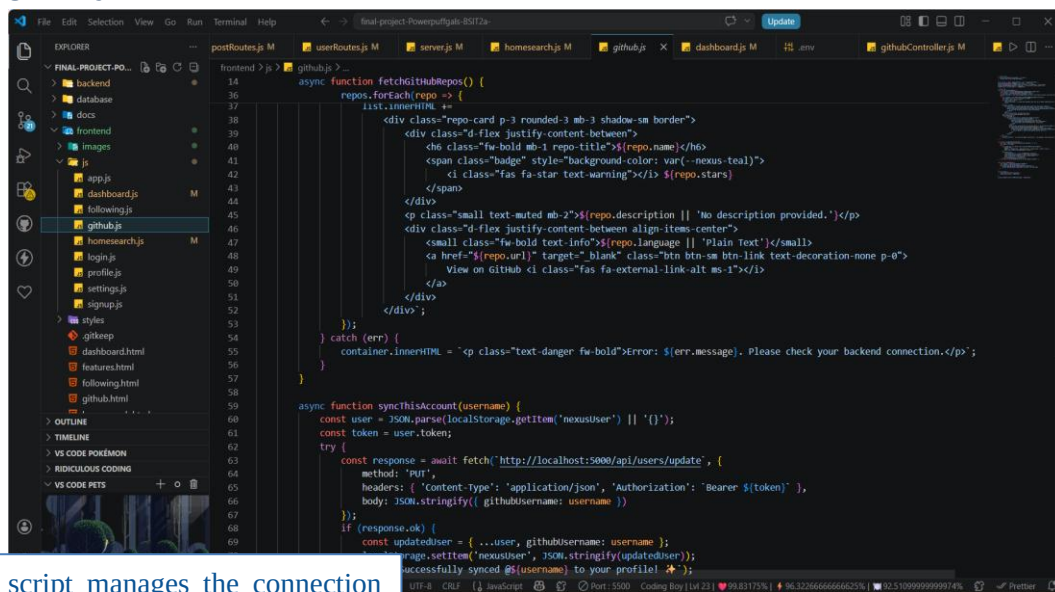

- cloudinary.js

```
1 const cloudinary = require('cloudinary').v2;
2 const { CloudinaryStorage } = require('multer-storage-cloudinary');
3 const multer = require('multer');
4
5 // Debugging to ensure .env is loading
6 console.log("Cloud Name Check:", process.env.CLOUDINARY_CLOUD_NAME);
7
8 cloudinary.config({
9   cloud_name: process.env.CLOUDINARY_CLOUD_NAME,
10  api_key: process.env.CLOUDINARY_API_KEY,
11  api_secret: process.env.CLOUDINARY_API_SECRET
12 });
13
14 const storage = new CloudinaryStorage({
15   cloudinary: cloudinary,
16   params: async (req, file) => {
17     // This dynamic approach is more reliable
18     return {
19       folder: 'nexus_writes',
20       // Setting format to undefined lets Cloudinary keep the original extension
21       format: undefined,
22       resource_type: 'auto',
23       public_id: file.originalname.split('.')[0] + '-' + Date.now(),
24     };
25   },
26 });
27
28 const upload = multer({ storage: storage });
29 module.exports = upload;
```

This code handles file upload integration with Cloudinary, allowing media files to be stored and accessed through cloud services.

- github.js

```
14 async function fetchGithubRepos() {
15   repos.forEach(repo => {
16     list.innerHTML +=
17       <div class="repo-card p-3 rounded-3 mb-3 shadow-sm border">
18         <div class="d-flex justify-content-between">
19           <div class="fw-bold mb-1 repo-title">${repo.name}</h6>
20           <span class="badge" style="background-color: var(--nexus-teal)">
21             <i class="fas fa-star text-warning"></i> ${repo.stars}
22           </span>
23         </div>
24         <p class="small text-muted mb-2">${repo.description || 'No description provided.'}</p>
25         <div class="d-flex justify-content-between align-items-center">
26           <small class="fw-bold text-info">${repo.language || 'Plain Text'}</small>
27           <a href="${repo.url}" target="_blank" class="btn btn-sm btn-link text-decoration-none p-0">
28             View on GitHub <i class="fas fa-external-link-alt ms-1"></i>
29           </a>
30         </div>
31       </div>;
32   });
33 }
34
35 } catch (err) {
36   container.innerHTML = <p class="text-danger fw-bold">Error: ${err.message}. Please check your backend connection.</p>;
37 }
38
39
40 async function syncThisAccount(username) {
41   const user = JSON.parse(localStorage.getItem('nexusUser')) || {};
42   const token = user.token;
43   try {
44     const response = await fetch('http://localhost:5000/api/users/update', {
45       method: 'PUT',
46       headers: { 'Content-Type': 'application/json', 'Authorization': 'Bearer ${token}' },
47       body: JSON.stringify({ githubUsername: username })
48     });
49     if (response.ok) {
50       const updatedUser = { ...user, githubUsername: username };
51       localStorage.setItem('nexusUser', JSON.stringify(updatedUser));
52       successfully syncd @${username} to your profile ⭐;
53     }
54   }
55 }
```

This script manages the connection between the frontend and backend by sending requests to API endpoints and processing responses.

V. Member Reflections

Ivy Angel Hidalgo (Project Manager & Backend Developer)

- I concentrated on making sure our backend endpoints are fully functional and can handle requests correctly. I also guided the team to ensure all parts of the system are already integrated and working together. There were some issues with responses and testing, but I managed to resolve them step by step. Phase 4 made me realize the importance of coordination and accuracy in both leadership and backend deployment.

Kris Ann Apoon (Frontend Developer)

- This week as a frontend developer, I focused on building the form interface to capture user data smoothly, adding validation so inputs were checked before being sent, and connecting everything to the backend with the Fetch API. I used Bootstrap Forms for a clean, responsive design and relied on Thunder Client to test the flow, while the backend team handled deeper checks with Postman and MongoDB Atlas. The biggest challenge was making sure my requests matched the backend's routes and payloads—small mismatches caused issues that took time to debug, but they taught me how crucial clear communication between frontend and backend really is.

April Grace Dacanay (Documentation Officer)

- In this phase I focused on documenting the complete workflow of the system from input to output. I gathered clear screenshots and added explanations to show how each part of the system functions. It was important to present everything in a way that is easy to follow. This phase helped me improve how I explain technical processes in a simple and organized manner.

Princes Mae Mateo (Database Manager)

- During this phase, I checked if all submitted data is correctly saved in the database and follows the required structure. I focused on verifying the accuracy and consistency of the stored data. Some entries needed adjustments but I made sure everything aligns with the schema. This phase strengthened my skills in maintaining data integrity.

Milan Rellora (GitHub Manager)

- I handled merging different branches and making sure all updates are properly combined in the repository. I focused on keeping the commit history clear and organized for better tracking. There were some merge conflicts, but I was able to resolve them carefully. This phase helped me understand the importance of maintaining a clean and collaborative workflow.
