Performance Report (Week 13) in IT 112: Web Systems and Technologies

2nd Semester A.Y 2025 - 2026

NEXUSWrites

"Your Tech, Your Story."

Group Name:

Powerpuffgals

Group Members:

Kris Ann B. Apoon

April Grace R. Dacanay

Ivy Angel R. Hidalgo

Princes Mae L. Mateo

Milan R. Rellora

Course & Block:

BSIT-2A

Help Center
How to create technical tutorials?
Use the dashboard 'Create Post' button. Our team supports live code snippets.
How does the GitHub integration work?
Provide your GitHub username in the github page to automatically display your public repositories, contribution history as a live technical resume and a button to sync the github repository to your profile.
How do I find specific technical topics?
Use the Search bar where you can choose from different categories such as Articles, Tutorials, and Resources. This ensures you find structured documentation rather than generic posts.
Is my account data secure?
Yes. We use Bcrypt.js for password encryption and JSON Web Tokens (JWT) for secure session management to keep your account protected.

II. JavaScript API Integration

- **cloudinary.js**

```javascript
const cloudinary = require('cloudinary').v2;
const { CloudinaryStorage } = require('multer-storage-cloudinary');
const multer = require('multer');

// Debugging to ensure .env is loading
console.log("Cloud Name Check:", process.env.CLOUDINARY_CLOUD_NAME);

cloudinary.config({
    cloud_name: process.env.CLOUDINARY_CLOUD_NAME,
    api_key: process.env.CLOUDINARY_API_KEY,
    api_secret: process.env.CLOUDINARY_API_SECRET
});

const storage = new CloudinaryStorage({
    cloudinary: cloudinary,
    params: async (req, file) => {
        // This dynamic approach is more reliable
        return {
            folder: 'nexus_writes',
            // Setting format to undefined lets Cloudinary keep the original extension
            format: undefined,
            resource_type: 'auto',
            public_id: file.originalname.split('.')[0] + '-' + Date.now(),
        };
    },
});

const upload = multer({ storage: storage });
module.exports = upload;
```

- **github.js**

```javascript
// Theme handling
if (localStorage.getItem('nexusTheme') === 'dark') {
    document.body.classList.add('dark-mode');
}

const current = { title: 'GitHub Projects', icon: 'fa-github text-dark' };
document.getElementById('pageHeader').innerText = current.title;
document.querySelectorAll('.section-name').forEach(el => el.innerText = current.title);
document.getElementById('pageIcon').innerHTML = `<i class="fas ${current.icon}"></i>`;
document.title = current.title + " | NEXUSWrites";

// GitHub Logic
async function fetchGitHubRepos() {
    const username = document.getElementById('githubUsername').value.trim();
    const container = document.getElementById('github-content');
    if (!username) { alert("Please enter a username"); return; }
    container.innerHTML = `<div class="spinner-border text-info" role="status"></div><p class="mt-2">Connecting to Nexus API...</p>
    try {
        const response = await fetch(`http://localhost:5000/api/github/${username}`);
        if (!response.ok) throw new Error("User not found");
        const repos = await response.json();
        if (repos.length === 0) {
            container.innerHTML = `<p class="text-secondary">This user has no public repositories.</p>`;
            return;
        }
        container.innerHTML = `
            <div class="mb-4 p-3 rounded-3 bg-light border border-info text-center shadow-sm">
                <p class="small mb-2 text-dark">Found <strong>${username}</strong>. Is this you?</p>
                <button class="btn btn-nexus-primary btn-sm w-100" onclick="syncThisAccount('${username}')">
                    <i class="fas fa-sync-alt me-2"></i> Sync to My Profile
                </button>
            </div>
            <div class="text-start" id="repo-list"></div>`;
        const list = document.getElementById('repo-list');
        repos.forEach(repo => {
            list.innerHTML += `
```

```javascript
async function fetchGitHubRepos() {
        repos.forEach(repo => {
            list.innerHTML +=
                <div class="repo-card p-3 rounded-3 mb-3 shadow-sm border">
                    <div class="d-flex justify-content-between">
                        <h6 class="fw-bold mb-1 repo-title">${repo.name}</h6>
                        <span class="badge" style="background-color: var(--nexus-teal)">
                            <i class="fas fa-star text-warning"></i> ${repo.stars}
                        </span>
                    </div>
                    <p class="small text-muted mb-2">${repo.description || 'No description provided.'}</p>
                    <div class="d-flex justify-content-between align-items-center">
                        <small class="fw-bold text-info">${repo.language || 'Plain Text'}</small>
                        <a href="${repo.url}" target="_blank" class="btn btn-sm btn-link text-decoration-none p-0">
                            View on GitHub <i class="fas fa-external-link-alt ms-1"></i>
                        </a>
                    </div>
                </div>`;
        });
    } catch (err) {
        container.innerHTML = `<p class="text-danger fw-bold">Error: ${err.message}. Please check your backend connection.</p>`;
    }
}

async function syncThisAccount(username) {
    const user = JSON.parse(localStorage.getItem('nexusUser') || '{}');
    const token = user.token;
    try {
        const response = await fetch(`http://localhost:5000/api/users/update`, {
            method: 'PUT',
            headers: { 'Content-Type': 'application/json', 'Authorization': `Bearer ${token}` },
            body: JSON.stringify({ githubUsername: username })
        });
        if (response.ok) {
            const updatedUser = { ...user, githubUsername: username };
            localStorage.setItem('nexusUser', JSON.stringify(updatedUser));
            alert(`Successfully synced @${username} to your profile! ✨`);
```

```javascript
async function syncThisAccount(username) {
        const response = await fetch(`http://localhost:5000/api/users/update`, {
            method: 'PUT',
            headers: { 'Content-Type': 'application/json', 'Authorization': `Bearer ${token}` },
            body: JSON.stringify({ githubUsername: username })
        });
        if (response.ok) {
            const updatedUser = { ...user, githubUsername: username };
            localStorage.setItem('nexusUser', JSON.stringify(updatedUser));
            alert(`Successfully synced @${username} to your profile! ✨`);
            window.location.href = 'profile.html';
        } else { alert("Failed to sync account."); }
    } catch (err) { alert("Connection error. Is your backend running?"); }
}

async function loadUserData() {
    const rawData = localStorage.getItem('nexusUser');
    const userData = JSON.parse(rawData || '{}');
    if (userData.name && document.getElementById('navUsername')) {
        document.getElementById('navUsername').innerText = userData.name;
    }
}

function logout() {
    localStorage.removeItem('nexusUser');
    window.location.href = 'login.html';
}

document.addEventListener('DOMContentLoaded', loadUserData);
```

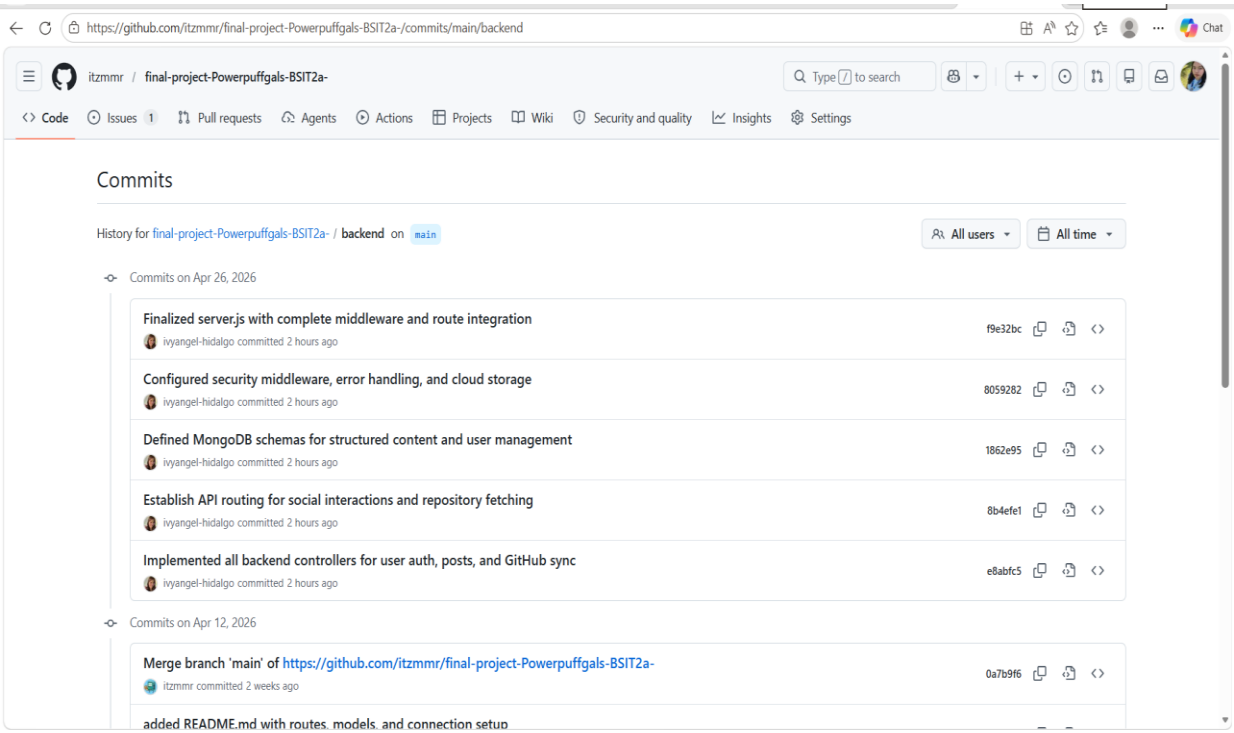
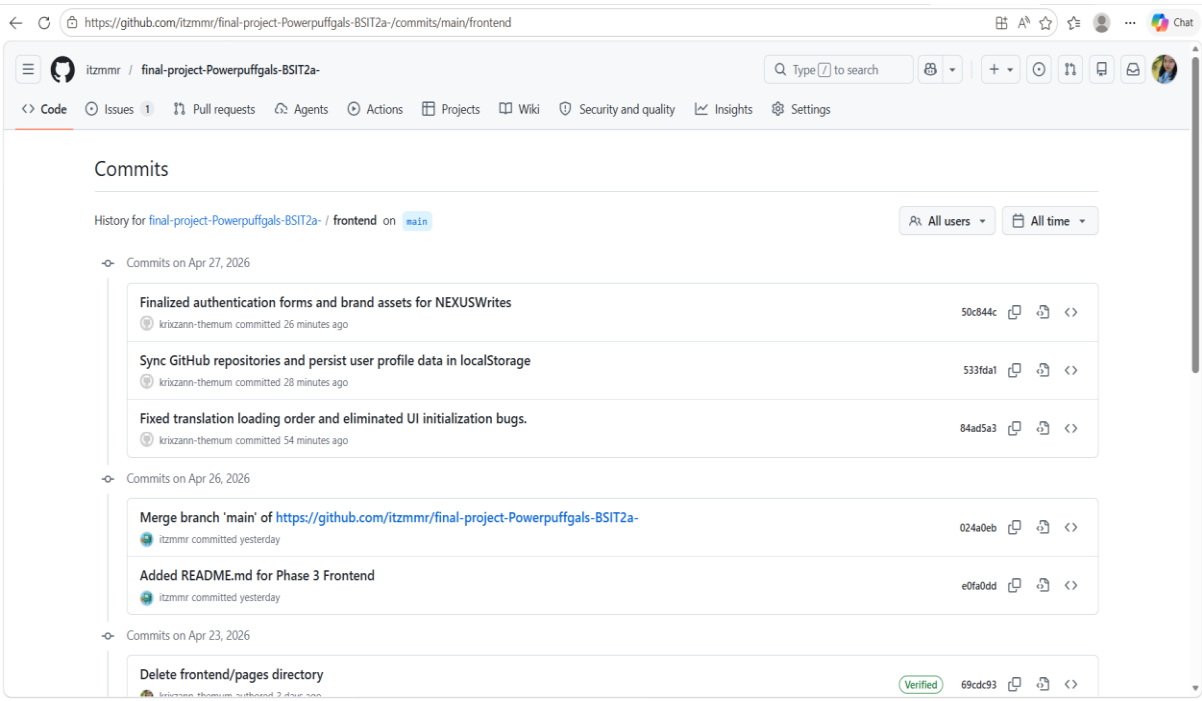
IV. Commit History Documentation





V. Member Reflections

Ivy Angel Hidalgo (Project Manager & Backend Developer)

- **I concentrated on making sure our backend endpoints are fully functional and can handle requests correctly. I also guided the team to ensure all parts of the system are already integrated and working together. There were some issues with responses and testing, but I managed to resolve them step by step. Phase 4 made me realize the importance of coordination and accuracy in both leadership and backend deployment.**

Kris Ann Apoon (Frontend Developer)

- **This week as a frontend developer, I focused on building the form interface to capture user data smoothly, adding validation so inputs were checked before being sent, and connecting everything to the backend with the Fetch API. I used Bootstrap Forms for a clean, responsive design and relied on Thunder Client to test the flow, while the backend team handled deeper checks with Postman and MongoDB Atlas. The biggest challenge was making sure my requests matched the backends' routes and payloads—small mismatches caused issues that took time to debug, but they taught me how crucial clear communication between frontend and backend really is.**

April Grace Dacanay (Documentation Officer)

- **In this phase I focused on documenting the complete workflow of the system from input to output. I gathered clear screenshots and added explanations to show how each part of the system functions. It was important to present everything in a way that is easy to follow. This phase helped me improve how I explain technical processes in a simple and organized manner.**

Princes Mae Mateo (Database Manager)

- **During this phase, I checked if all submitted data is correctly saved in the database and follows the required structure. I focused on verifying the accuracy and consistency of the stored data. Some entries needed adjustments, but I made sure everything aligns with the schema. This phase strengthened my skills in maintaining data integrity.**

Milan Rellora (GitHub Manager)

- **I handled merging different branches and making sure all updates are properly combined in the repository. I focused on keeping the commit history clear and organized for better tracking. There were some merge conflicts, but I was able to resolve them carefully. This phase helped me understand the importance of maintaining a clean and collaborative workflow.**
